

Part 2

Identification based adaptive systems

teoreetiline materjal: prof. Ennu Rüstern'i loengumaterjal "Ülevaade adaptiivsüsteemidest"

Structure of the control system

Control of a Linear System

Controlled System: $A(z)y(k)=B(z)u(k)$

Linear Controller: $R(z)u(k)=T(z)w(k)-S(z)y(k)$

Reference model: $A_m(z)y_m(z)=B_m(z)w(k)$

Closed loop system: $y(k) = \frac{B(z)T(z)}{A(z)R(z) + B(z)S(z)} w(k)$

Controller design criteria:

$$\frac{\mathbf{B(z)T(z)}}{\mathbf{A(z)R(z) + B(z)S(z)}} = \frac{\mathbf{B_m(z)}}{\mathbf{A_m(z)}}$$

Control of a 2nd order linear discrete time system

Controlled System:

$$A(z) = z^2 + a_1 z + a_2$$
$$B(z) = b_1 z + b_2$$

Reference model:

$$A_m(z) = z^2 + a_{m1} z + a_{m2} = (z - z_1)(z - z_2)$$
$$B_m(z) = b_{m1} z + b_{m2}$$

Linear controller:

$$T(z) = b_{m1}/b_1 z + b_{m2}/b_1$$
$$R(z) = z + b_2/b_1$$
$$S(z) = (a_{m1} - a_1)/b_1 z + (a_{m2} - a_2)/b_1$$

Recurrent estimation

Data vector: $\varphi^T(\mathbf{k}) = [-y(\mathbf{k}-1), \dots, -y(\mathbf{k}-n); u(\mathbf{k}-d-1), \dots, u(\mathbf{k}-d-m)]$

Parameter vector: $\hat{\Theta}^T(\mathbf{k}-1) = [a_1, \dots, a_n; b_1, \dots, b_m]$

Model: $y(\mathbf{k}) = \varphi^T(\mathbf{k})\hat{\Theta}(\mathbf{k}-1) + e(\mathbf{k})$

Parameter estimation:

Where $\hat{\Theta}(\mathbf{k}) = \hat{\Theta}(\mathbf{k}-1) + \mathbf{K}(\mathbf{k})[y(\mathbf{k}) - \varphi(\mathbf{k})\hat{\Theta}(\mathbf{k}-1)]$

$$\mathbf{P}(\mathbf{k}) = \frac{1}{\lambda} \left(\mathbf{P}(\mathbf{k}-1) - \frac{\mathbf{P}(\mathbf{k}-1)\varphi(\mathbf{k})\varphi^T(\mathbf{k})\mathbf{P}(\mathbf{k}-1)}{\lambda + \varphi^T(\mathbf{k})\mathbf{P}(\mathbf{k}-1)\varphi(\mathbf{k})} \right)$$

$\mathbf{K}(\mathbf{k}) = \mathbf{P}(\mathbf{k})\varphi(\mathbf{k})$,

$\mathbf{P}(\mathbf{k})$ and $\mathbf{P}(\mathbf{k}-1)$ are $(n+m) \times (n+m)$ covariance matrices of parameter estimations,

$\mathbf{K}(\mathbf{k})$ is a vector of weighting coefficients,

λ ($\lambda < 1$) is a memory coefficient.

2 order system's parameters estimation

Data vector: $\boldsymbol{\varphi}^T(\mathbf{k}) = [-\mathbf{y}(\mathbf{k}-1), -\mathbf{y}(\mathbf{k}-2); \mathbf{u}(\mathbf{k}-1), \mathbf{u}(\mathbf{k}-2)]$

Parameter vector: : $\hat{\boldsymbol{\Theta}}^T(k-1) = [a_1, a_2; b_1, b_2]$

Model: $\mathbf{y}(\mathbf{k}) = \boldsymbol{\varphi}^T(\mathbf{k})\hat{\boldsymbol{\Theta}}(\mathbf{k}-1) + \mathbf{e}(\mathbf{k})$

Parameter estimation: $\hat{\boldsymbol{\Theta}}(k) = \hat{\boldsymbol{\Theta}}(k-1) + K(k)[y(k) - \boldsymbol{\varphi}^T(k)\hat{\boldsymbol{\Theta}}(k-1)]$,

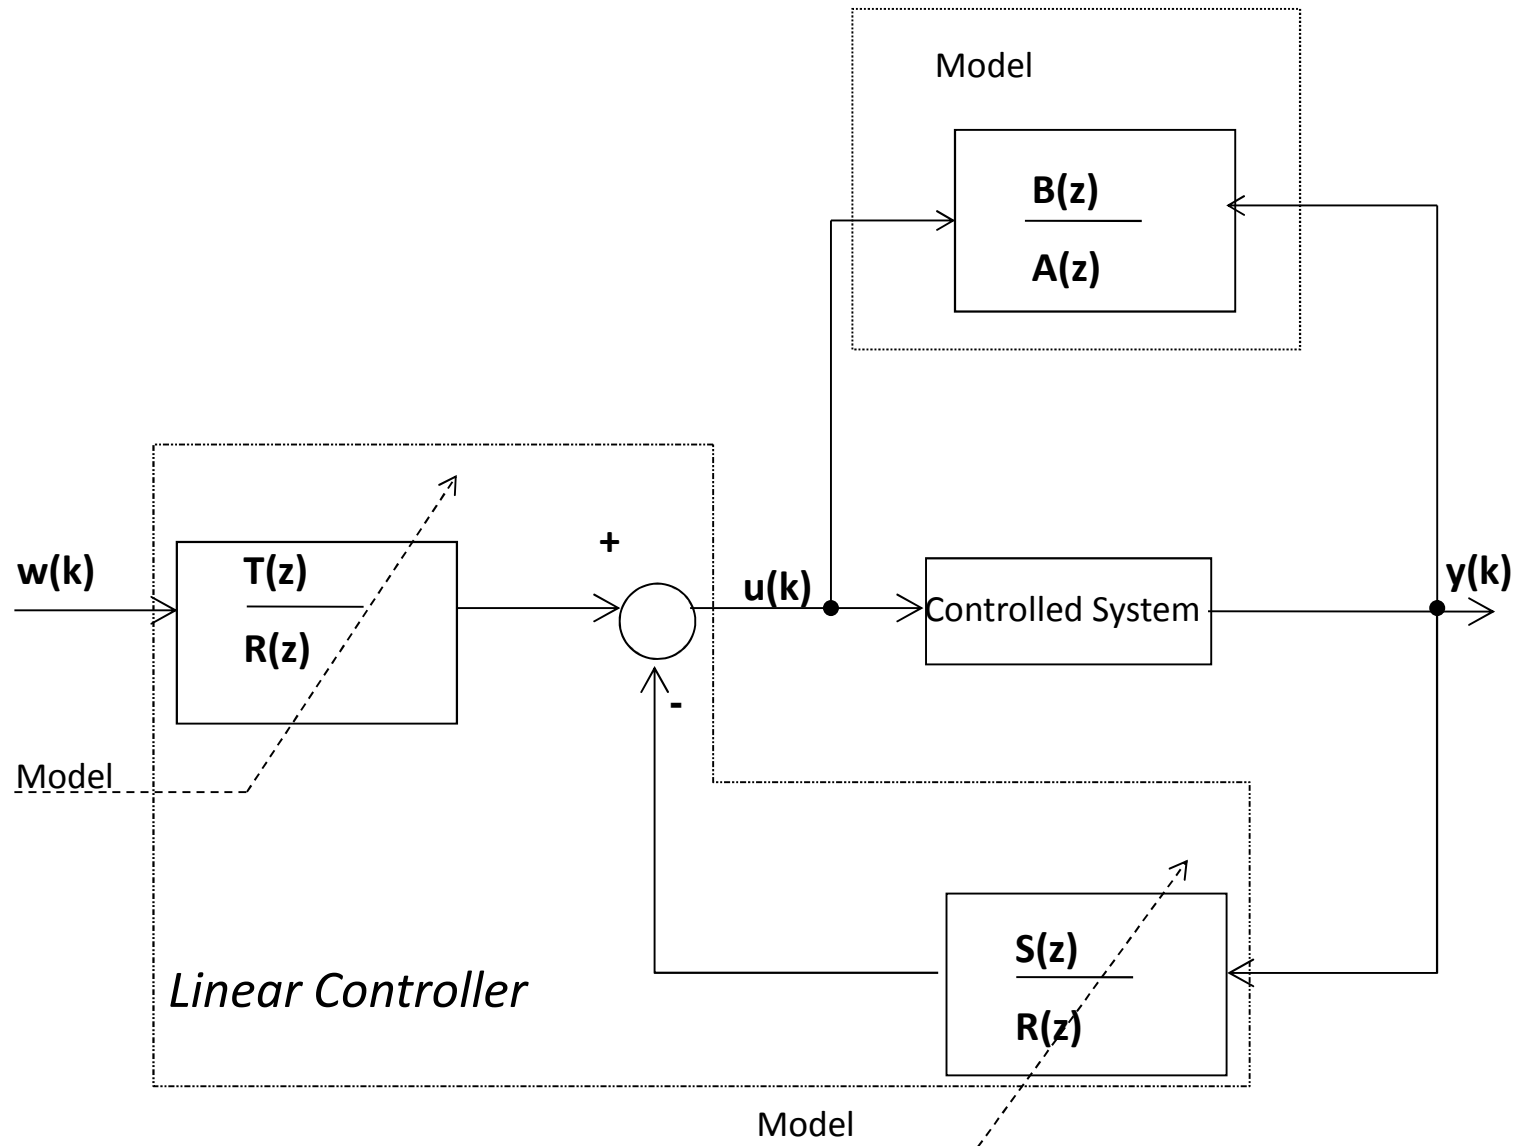

Here $\mathbf{P}(\mathbf{k}) = \frac{1}{\lambda} \left(\mathbf{P}(\mathbf{k}-1) - \frac{\mathbf{P}(\mathbf{k}-1)\boldsymbol{\varphi}(\mathbf{k})\boldsymbol{\varphi}^T(\mathbf{k})\mathbf{P}(\mathbf{k}-1)}{\lambda + \boldsymbol{\varphi}^T(\mathbf{k})\mathbf{P}(\mathbf{k}-1)\boldsymbol{\varphi}(\mathbf{k})} \right)$

$\mathbf{K}(\mathbf{k}) = \mathbf{P}(\mathbf{k})\boldsymbol{\varphi}(\mathbf{k})$,

$\mathbf{P}(\mathbf{k})$ and $\mathbf{P}(\mathbf{k}-1)$ are **4x4** covariance matrices of parameter estimations,

$\mathbf{K}(\mathbf{k})$ is a vector of weighting coefficients,
 λ is a memory coefficient ($\lambda < 1$).

Adaptive control

Test Plant

$$H(z) = \frac{z + 0.5}{z^2 - 1.5z + 0.5}$$

$$\begin{cases} a_1 = -1.5 \\ a_2 = 0.7 \\ b_1 = 1.0 \\ b_2 = 0.5 \end{cases}$$
